

Additional 6.5 Notes

Triangle Proportionality

Compares the *pieces* of the triangle that are cut by the parallel lines

→ Think of the figure as one big triangle cut into parts.

$$\begin{array}{l} \text{Top Piece} \longrightarrow \frac{AD}{DB} = \frac{AE}{EC} \\ \text{Bottom Piece} \longrightarrow \end{array}$$

Similar Triangles

Compares the *full sides* lengths of the triangles

→ Think of the figure as two triangles, a big one and a little one.

$$\begin{array}{l} \text{Little Triangle} \longrightarrow \frac{AD}{AB} = \frac{DE}{BC} \\ \text{Big Triangle} \longrightarrow \end{array}$$

Examples

1.

$$\begin{array}{l} \frac{33}{x} = \frac{27}{18} \\ x = 22 \end{array}$$

2.

$$\begin{array}{l} \frac{x}{15} = \frac{8}{12} \\ x = 10 \end{array}$$

3.

$$\begin{array}{l} \text{Triangle Proportionality Theorem: } \frac{12}{x} = \frac{15}{6} \\ x = 4.8 \end{array}$$

$$\begin{array}{l} \text{Similar Triangles: } \frac{10}{y} = \frac{15}{21} \\ y = 14 \end{array}$$
